Lab 4-Consuming APIs in flutter

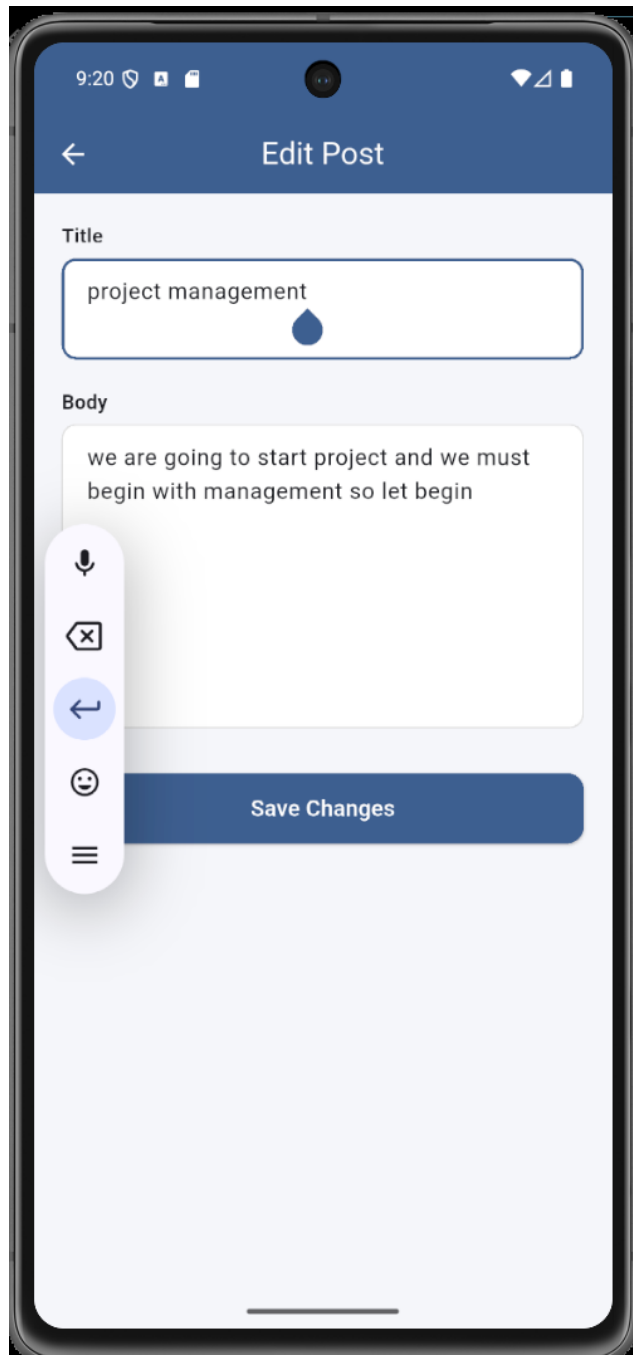

1.HOME SCREEN PAGE

This page is a **Posts Manager** screen used to display and manage a list of posts. Each post shows a title, a short description, and a numbered badge for easy identification. Users can update a post using the **Edit** button or remove it using the **Delete** button. A refresh icon at the top allows reloading the list of posts. The “**New Post**” button at the bottom lets users quickly add a new post.

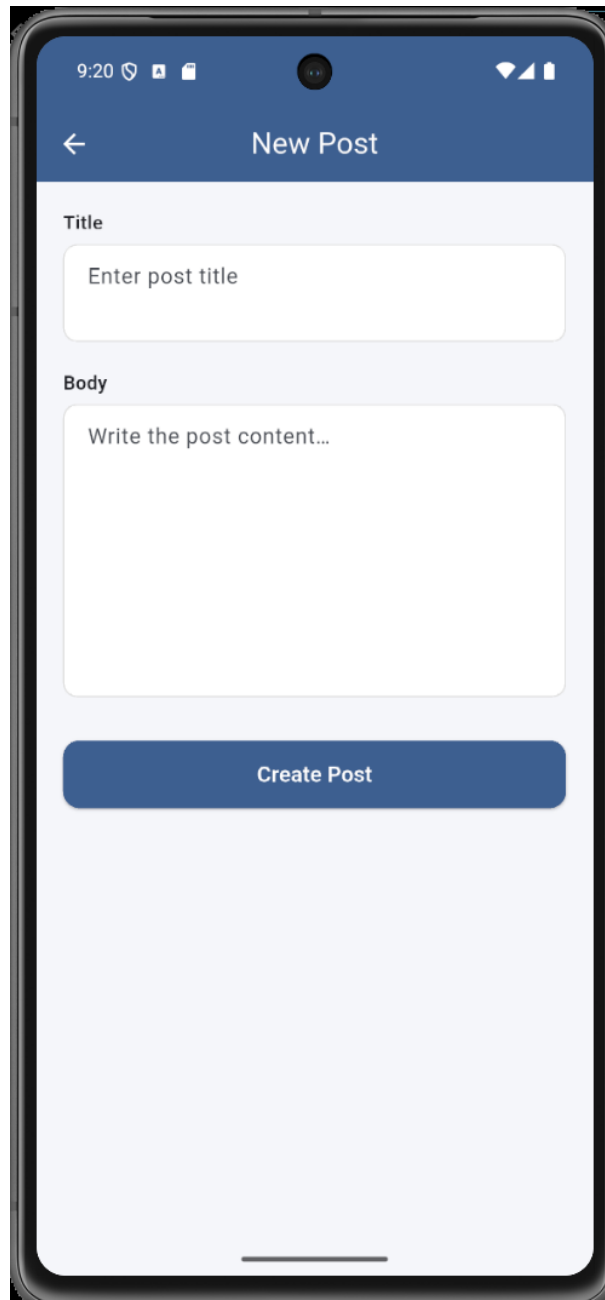

2.EDIT SCREEN PAGE

This page is an **Edit Post** screen used to modify an existing post. It contains a **Title** field where the user can change the post's heading. The **Body** section allows editing the main content or description of the post. A back arrow at the top lets the user return to the previous screen without saving. The **Save Changes** button updates and stores the edited post details.

3.CREATE POST SCREEN

This page is a **New Post** screen used to create a new post. It has a **Title** field where the user enters the post heading. The **Body** section allows the user to write the main content of the post. A back arrow at the top lets the user return without saving anything. The **Create Post** button saves and adds the new post to the list.

Enter post title

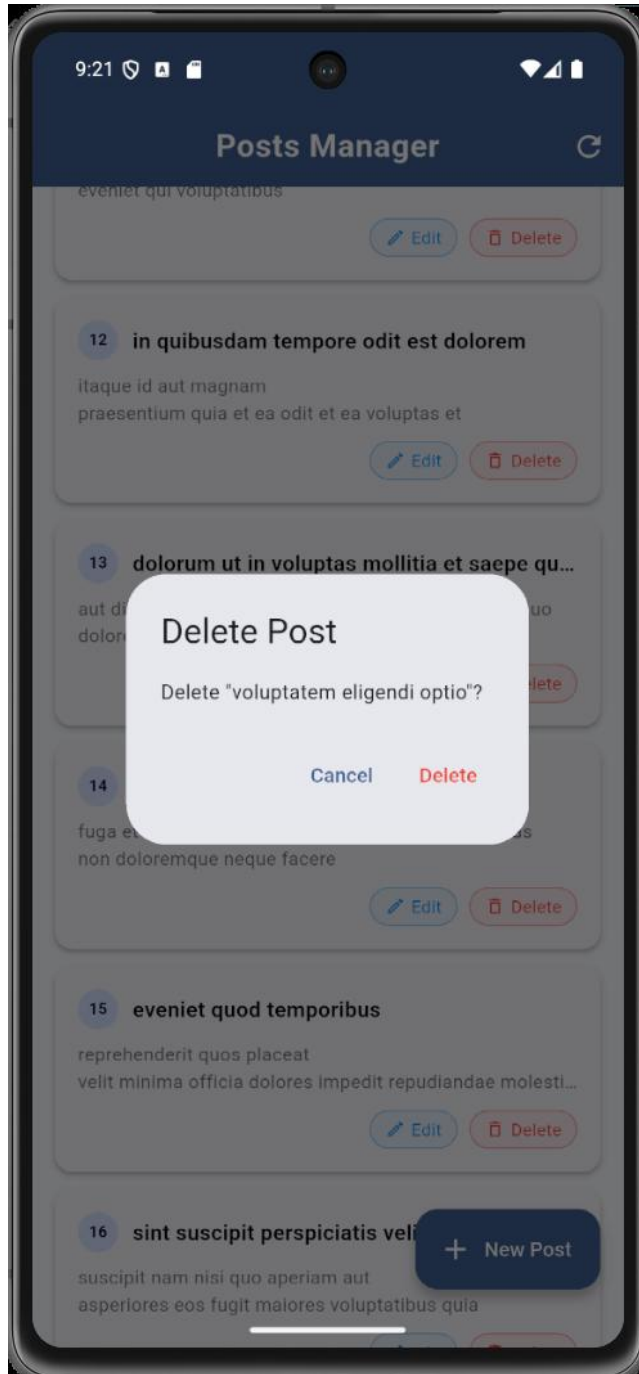

Body

Write the post content...

Create Post

4.DELETE POST SCREEN PAGE

This is a Delete screen where we confirm the removal of a selected post, displaying the message **"Delete voluptatem eligendi optio?"** with two options — **Cancel** to go back and **Delete** in red to permanently remove it.

CONCLUSION

So, above are all screenshots taken to describe the API integration in flutter focusing only on front end and they describe how to build an mobile interface that communicate with API and display data to the users.

And we created the following functionalities: View all available posts, Read the details of a post, Create a new post, Edit an existing post and Delete a post as it was recommended in assignment.
